Question 4.1, Figure 1. Anomaly time series of polar surface air temperature (A, G, updated from Jones and Moberg, 2003), Arctic and Antarctic sea ice extent (B, F, updated from Comiso, 2003), Northern Hemisphere (NH) frozen ground extent (C, Zhang et al., 2003), NH snow cover extent (D, updated from Brown et al., 2000) and global glacier mass balance (E, Ohmura, 2004; Cogley, 2005; Dyurgerov and Meier, 2005). The solid red line in E denotes the cumulative global glacier mass balance; otherwise it represents the smoothed time series using a 13-point filter (see Chapter 3).

Temperatures in Polar Regions

Surface Air Temperature Anomalies (w.r.t. 1961-1990)

**Trend
(last 50 years):**

$$T_{\text{Arctic}} = 1,1^{\circ}\text{C}$$

$$T_{\text{global}} = 0,6^{\circ}\text{C}$$

Ice age at the end of the 2007 and 2008 melt seasons

ECOSYSTEMS

SUSTAINABLE?

Projet Malina (2008-2012)

Question:

Quel est l'impact des modifications du couvert de glace, du permafrost et du rayonnement UV sur la biodiversité, et sur les flux de carbone affectés par la lumière?

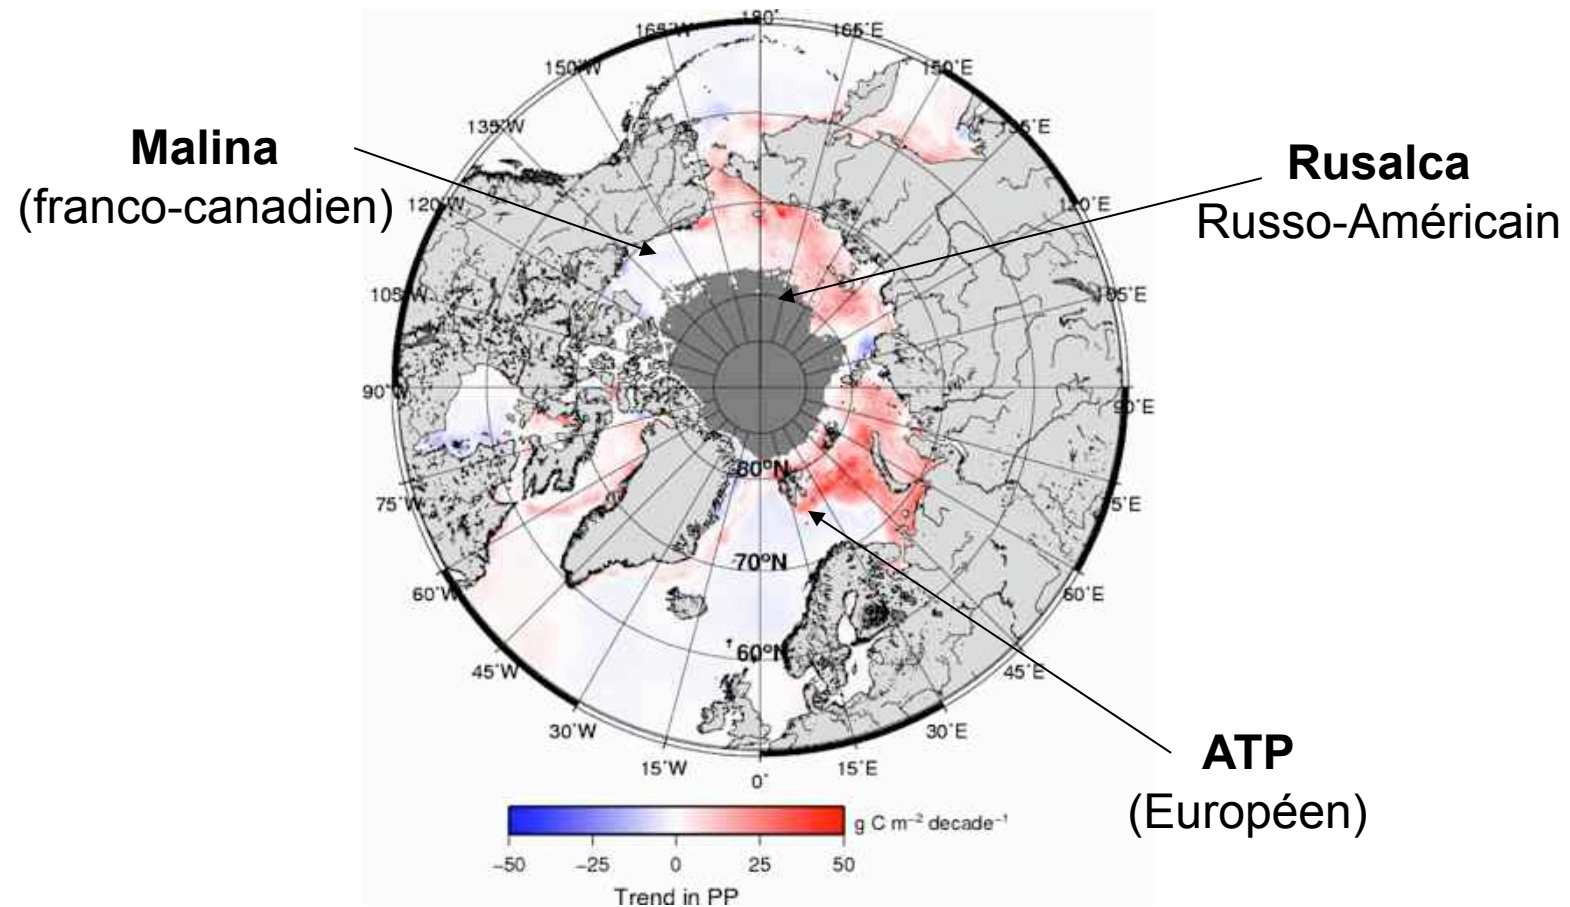

Faits saillants:

- France – Canada – USA
- Campagne été 2009
- Etudes de processus
- Suivi par télédétection
- Modélisation (présent & futur)
- Paléocéanographie

By September 2002, the Arctic sea-ice concn. anomaly cf 1988-2000 had reached a minimum *'unprecedented in 24 years of passive microwave obs and almost certainly unmatched in 50 years of charting Arctic sea-ice'* (Serreze 2003; Fetterer & Knowles, 2004).
