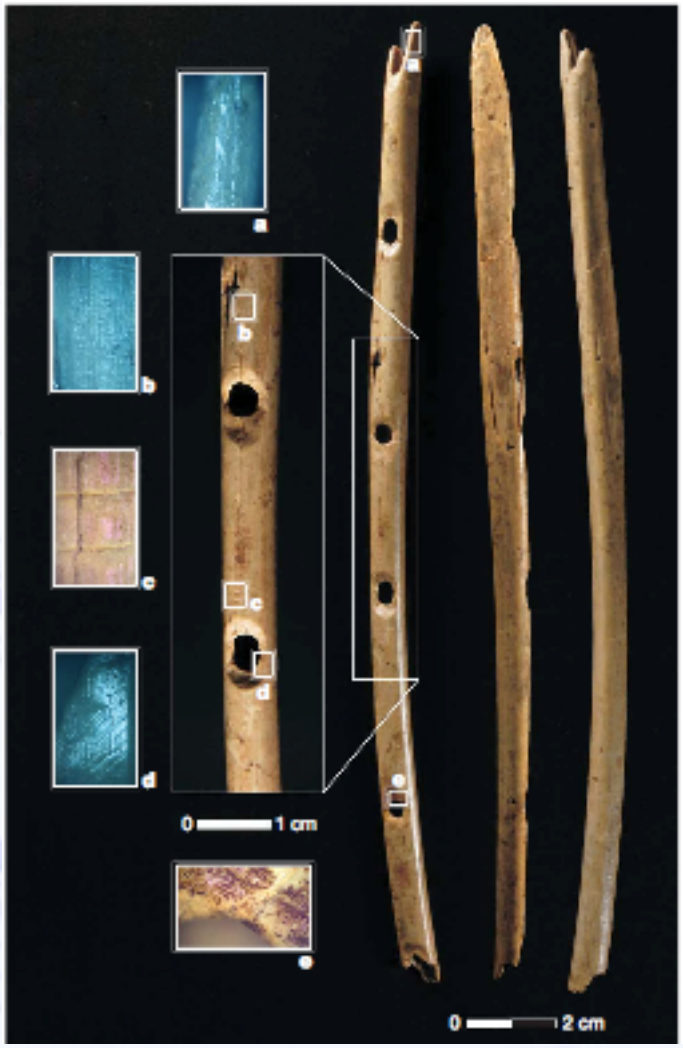
La musique transcende le temps, l'espace et la culture

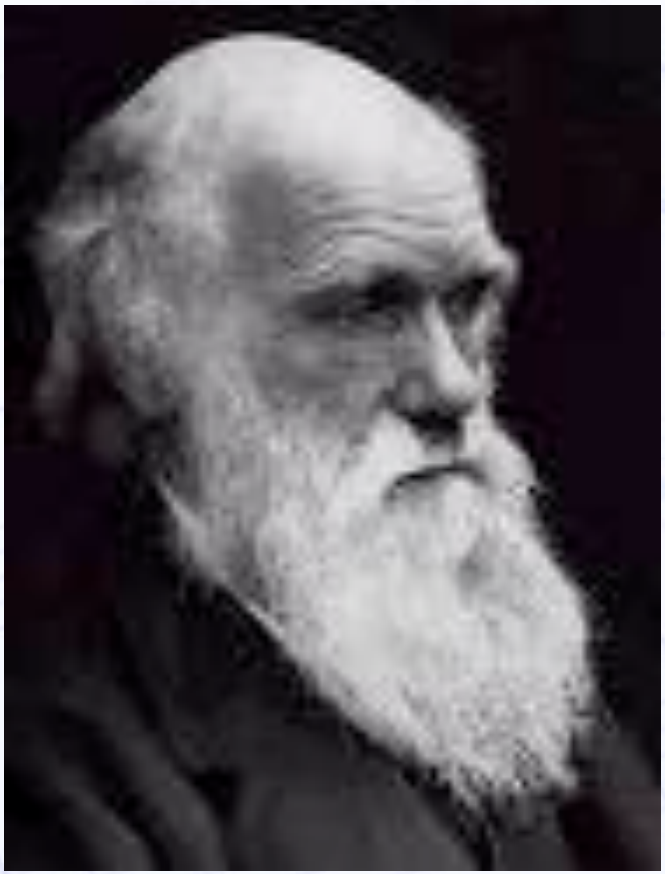
Tout comme la parole, la musique:

- ✓ Remonte à la pré-histoire
- ✓ Universelle
- ✓ Un trait humain?
- ✓ Acquise très tôt et spontanément
- ✓ Code auditivo-vocal élaboré
- ✓ Mobilise de nombreux systèmes (perception, motricité, émotions, mémoire, attention, imagination,...)

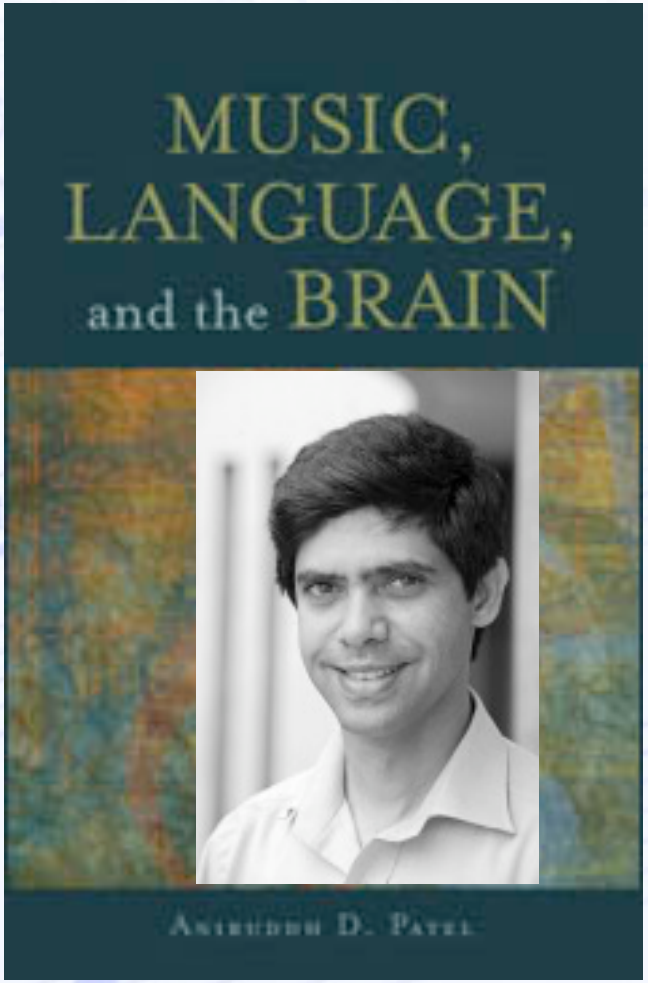


Conard et al., Nature, 2009

"As neither the enjoyment nor the capacity of producing musical notes are faculties of the least use to man in reference to his daily habits of life, they must be ranked among the most mysterious with which he is endowed" (Darwin, 1871)



La musique, est-elle un dérivé du langage ?



L'aphasie congénitale: du comportement aux gènes

- Phenotype
  - Sévère difficulté à reproduire mots et non-mots
  - Apraxie oro-faciale
- Particularités cérébrales
  - Niveau de matière grise anormale dans le noyau caudé, le gyrus frontal inférieur (Broca), dans le Gyrus angulaire (Wernicke) et le putamen.
- Gènes
  - Héréditaire
  - FOXP2

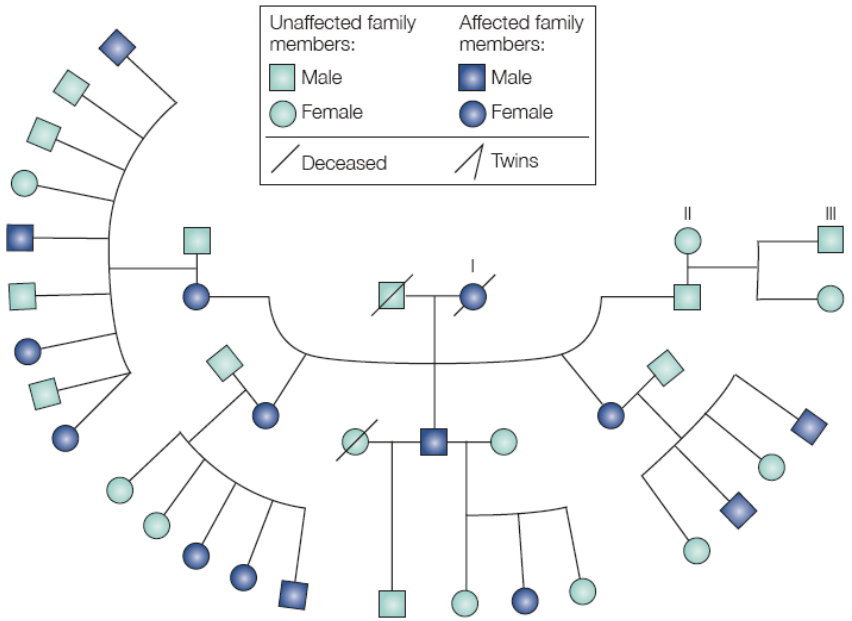


Figure 1 | **Pedigree of the KE family.** I, II and III represent the generations. Modified, with permission, from S FG 25 © (2002) Oxford University Press.

Vargha-Khadem et al (2005) *Nature Reviews/Neuroscience*

L'aphasie congénitale: du comportement aux gènes

- FOXP2 et chant
  - Anomalie du rythme (production et perception)
  - Mélodie normale (production et perception)

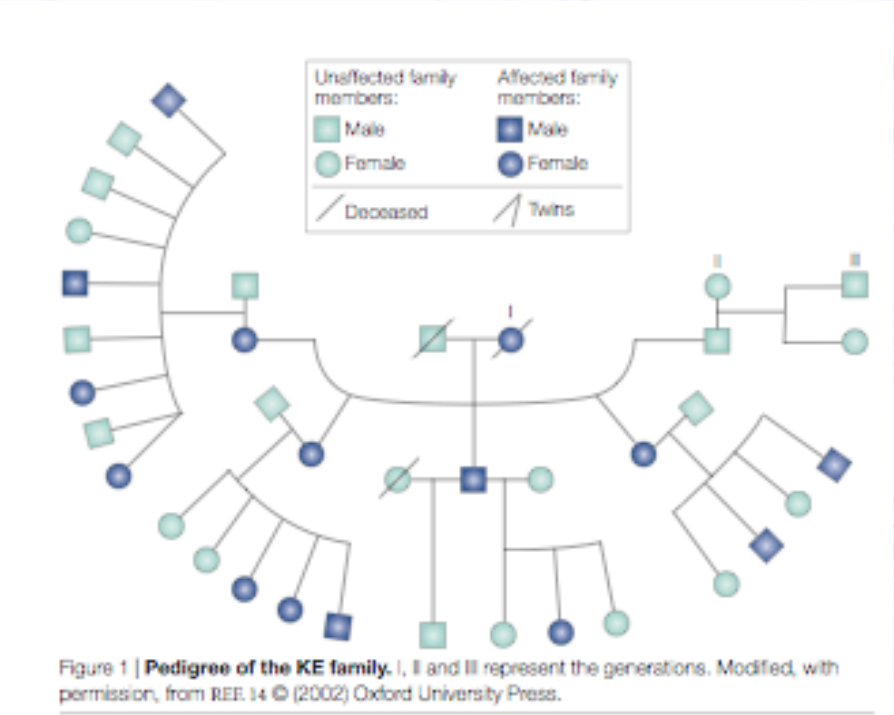

Figure 1 | **Pedigree of the KE family.** I, II and III represent the generations. Modified, with permission, from REF. 14 © (2002) Oxford University Press.

Alcock et al. (2000) *Brain & Language*

L’amusie congénitale: du comportement aux gènes

L'amusie congénitale

Echec à développer une compétence musicale normale alors que l'intelligence est normale et le langage aussi

- ✓ Ne savent pas s'ils chantent juste
- ✓ Echouent à reconnaître les chansons en l'absence des paroles
- ✓ Difficulté à apprendre la musique
- ✓ Aucune autre difficulté d'apprentissage

4 % de la population normale (Kalmus & Frey, 1980. *Annals of Human Genetics).*

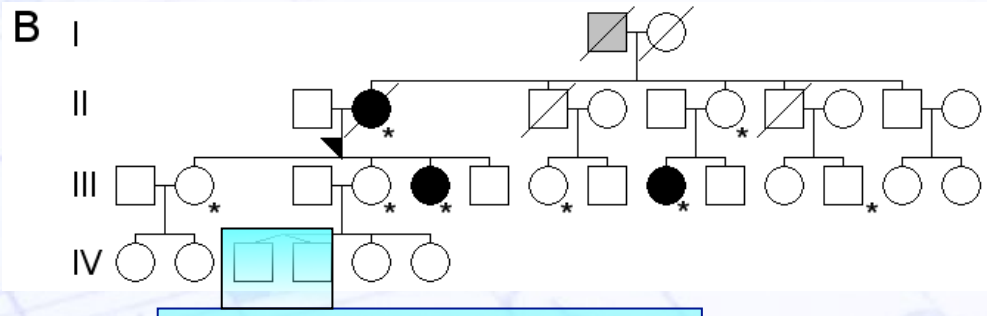
Amusie congénitale: du comportement aux gènes

- phenotype
  - Pitch-based deficit
- Neural phenotype
  - impoverished connectivity in a right-hemisphere based network involving the inferior frontal cortex and the auditory cortex
- Genes
  - Hereditary
  - DNA analysis in progress
  - Exposure to a tonal language is not a moderating factor



DZ male twins
The affected plays music
The unaffected does not

Questions en suspens: recherche en cours

- ✓ Plasticité: est-ce qu'un entrainement ciblé chez l'enfant peut compenser pour son trouble ?
- ✓ Est-ce que l'amusie vocale existe indépendemment?
- ✓ Un problème d'"awareness" ?
- ✓ Peut-on induire l'amusie chez l'individu normal?
