Three broad classes of mechanisms for pseudogap

- Phase with a broken symmetry (discrete)
- Mott Physics
- Precursor of LRO ($d = 2$)
 - Mermin-Wagner allows a large fluctuation regime
 - Even with weak correlations

Local moment and Mott transition

Understanding finite temperature phase from a *mean-field theory* down to $T = 0$

A finite-doping first order transition, linked to Mott transition up to optimal doping

Doping dependence of critical point as a function of U

Sordi et al. PRL 2010, PRB 2011

Strong correlation pseudogap ($U > 8t$)

- Different from Mott gap that is local (all k) not tied to $\omega=0$.
- Pseudogap tied to $\omega=0$ and only in regions nearly connected by (π,π) . (e and h),
- Pseudogap is independent of cluster shape (and size) in CPT.
- Not caused by AFM LRO
 - No LRO, few lattice spacings.
 - Not very sensitive to t'
 - Scales like t .

Hole-doped, 10%

$U=8$

F. Ronning et al. Jan. 2002, $\text{Ca}_{2-x}\text{Na}_x\text{CuO}_2\text{Cl}_2$

Sénéchal, AMT, PRL **92**, 126401 (2004).

UNIVERSITÉ DE
SHERBROOKE

Weak-correlation pseudogap (e-doped cuprates)

- In CPT
 - is mostly a depression in weight
 - depends on system size and shape.
 - located precisely at intersection with AFM Brillouin zone
- Coupling weaker, better screened $U(n) \sim d\mu/dn$

Sénéchal, AMT, PRL **92**, 126401 (2004).

Middle segment disappears for $U \sim 6$, (also slave bosons)

Q. Yuan, F. Yuan, and C. S. Ting, PRB **72**, 054504 (2005).

Armitage et al. PRL **88** 257001 (2002)

Different crystal structures

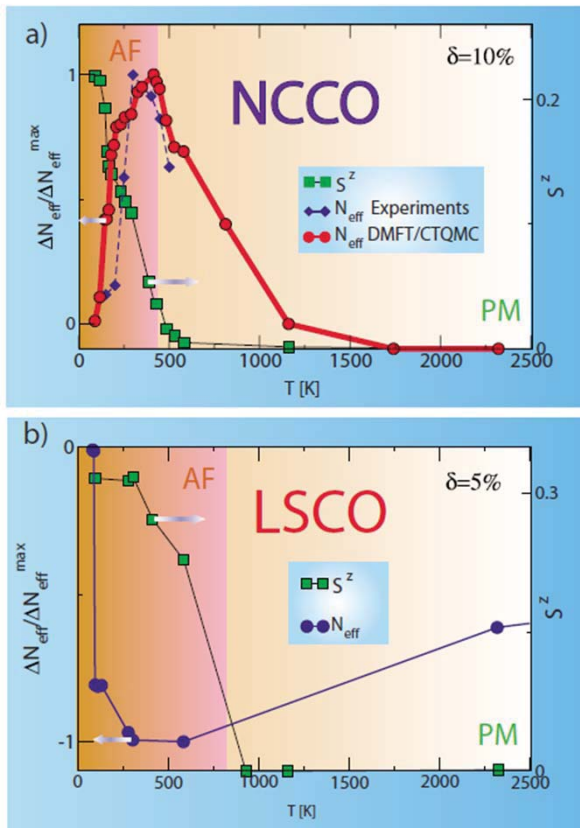

N. P. Armitage, P. Fournier, and R. L. Greene RMP **82**, 2421 (2010)

LDA + DMFT

C. Weber, K. Haule, G. Kotliar, PRB **82**, 125107 2010

C. Weber, K. Haule, G. Kotliar, Nature Physics, **6**, 574 (2010)

$N_{eff} - N_{eff}(89 K)$

$$N_{eff} = (2 m_e V / \hbar \pi e^2) \int_0^\Lambda \sigma'(\omega) d\omega$$

$$\Lambda \sim 1.4 eV$$

Experiments, dashed line

Y. Onose, Y. et al. PRB **69**, 024504 (2004).

Theoretical difficulties

- Low dimension
 - (quantum and thermal fluctuations)
- Large residual interactions
 - (Potential \sim Kinetic)
 - Expansion parameter?
 - Particle-wave?
- By now we should be as quantitative as possible!

Theory difficult even at weak to intermediate correlation!

- RPA (OK with conservation laws)

- Mermin-Wagner

- Pauli

- Moryia (Conjugate variables HS $\phi^4 = \langle \phi^2 \rangle \phi^2$)

- Adjustable parameters: c and U_{eff}

- Pauli

- FLEX

- No pseudogap

- Pauli

- Renormalization Group

- 2 loops

Zanchi Schultz, (2000)

Rohe and Metzner (2004)

Katanin and Kampf (2004)

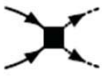

Weak correlation methods

- Functional renormalization group

(a) ∂_ℓ  = 

+  + ...

∂_ℓ  =  + ...

D. Zanchi and H.J. Schulz, PRB 61, 13609 (2000)

C. Honerkamp, et al. PRB 63, 035109 (2001)

Rohe and Metzner (2004)

Katanin and Kampf (2004)

R. Shankar, Rev. Mod. Phys. 66, 129 (1994)

C. Bourbonnais Sedeki PRB 2012

(b) ∂_ℓ  =  +  + ...

- Other weak coupling methods

– N.E. Bickers, et al. Phys. Rev. Lett. 62, 961 (1989) FLEX

Theory without small parameter: How should we proceed?

- Identify important physical principles and laws to constrain non-perturbative approximation schemes
 - From weak coupling (kinetic)
 - From strong coupling (potential)
- Benchmark against “exact” (numerical) results.
- Check that weak and strong correlation approaches agree in intermediate range.
- Compare with experiment

Outline for today

- Comparisons with experiment
 - Agreement does not mean accurate solution of Hubbard
- Benchmarks
 - Quantum Monte Carlo for large systems
- How it works
 - Physical principles
- ---
- Derivation and analytic: Mermin-Wagner + pseudogap

A.-M.S.T, *Theoretical Methods for Strongly Correlated Systems*, edited by A. Avella and F. Mancini (Springer, New York, 2011), Chap. 13, p. 409; e-print arXiv:1107.1534.

TPSC: Theory vs experiment

The pseudogap in electron-doped cuprates

Our road map

Thèse de Francis Laliberté,
Université de Sherbrooke

Model parameters

$$H = - \sum_{\langle ij \rangle \sigma} t_{i,j} (c_{i\sigma}^\dagger c_{j\sigma} + c_{j\sigma}^\dagger c_{i\sigma}) + U \sum_i n_{i\uparrow} n_{i\downarrow}$$

fixed

$$t' = -0.175t, t'' = 0.05t$$

$$t = 350 \text{ meV}, T = 200 \text{ K}$$

Weak coupling $U < 8t$

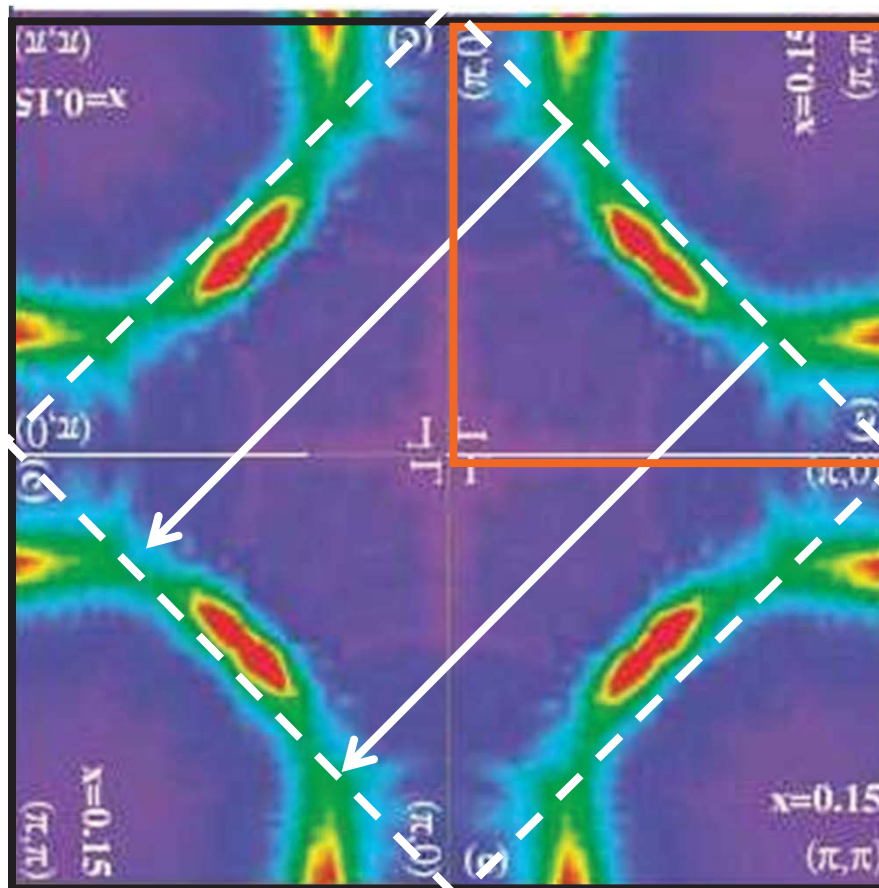

$n = 1 + x$ – electron filling

Hot spots from AFM quasi-static scattering

Mermin-Wagner

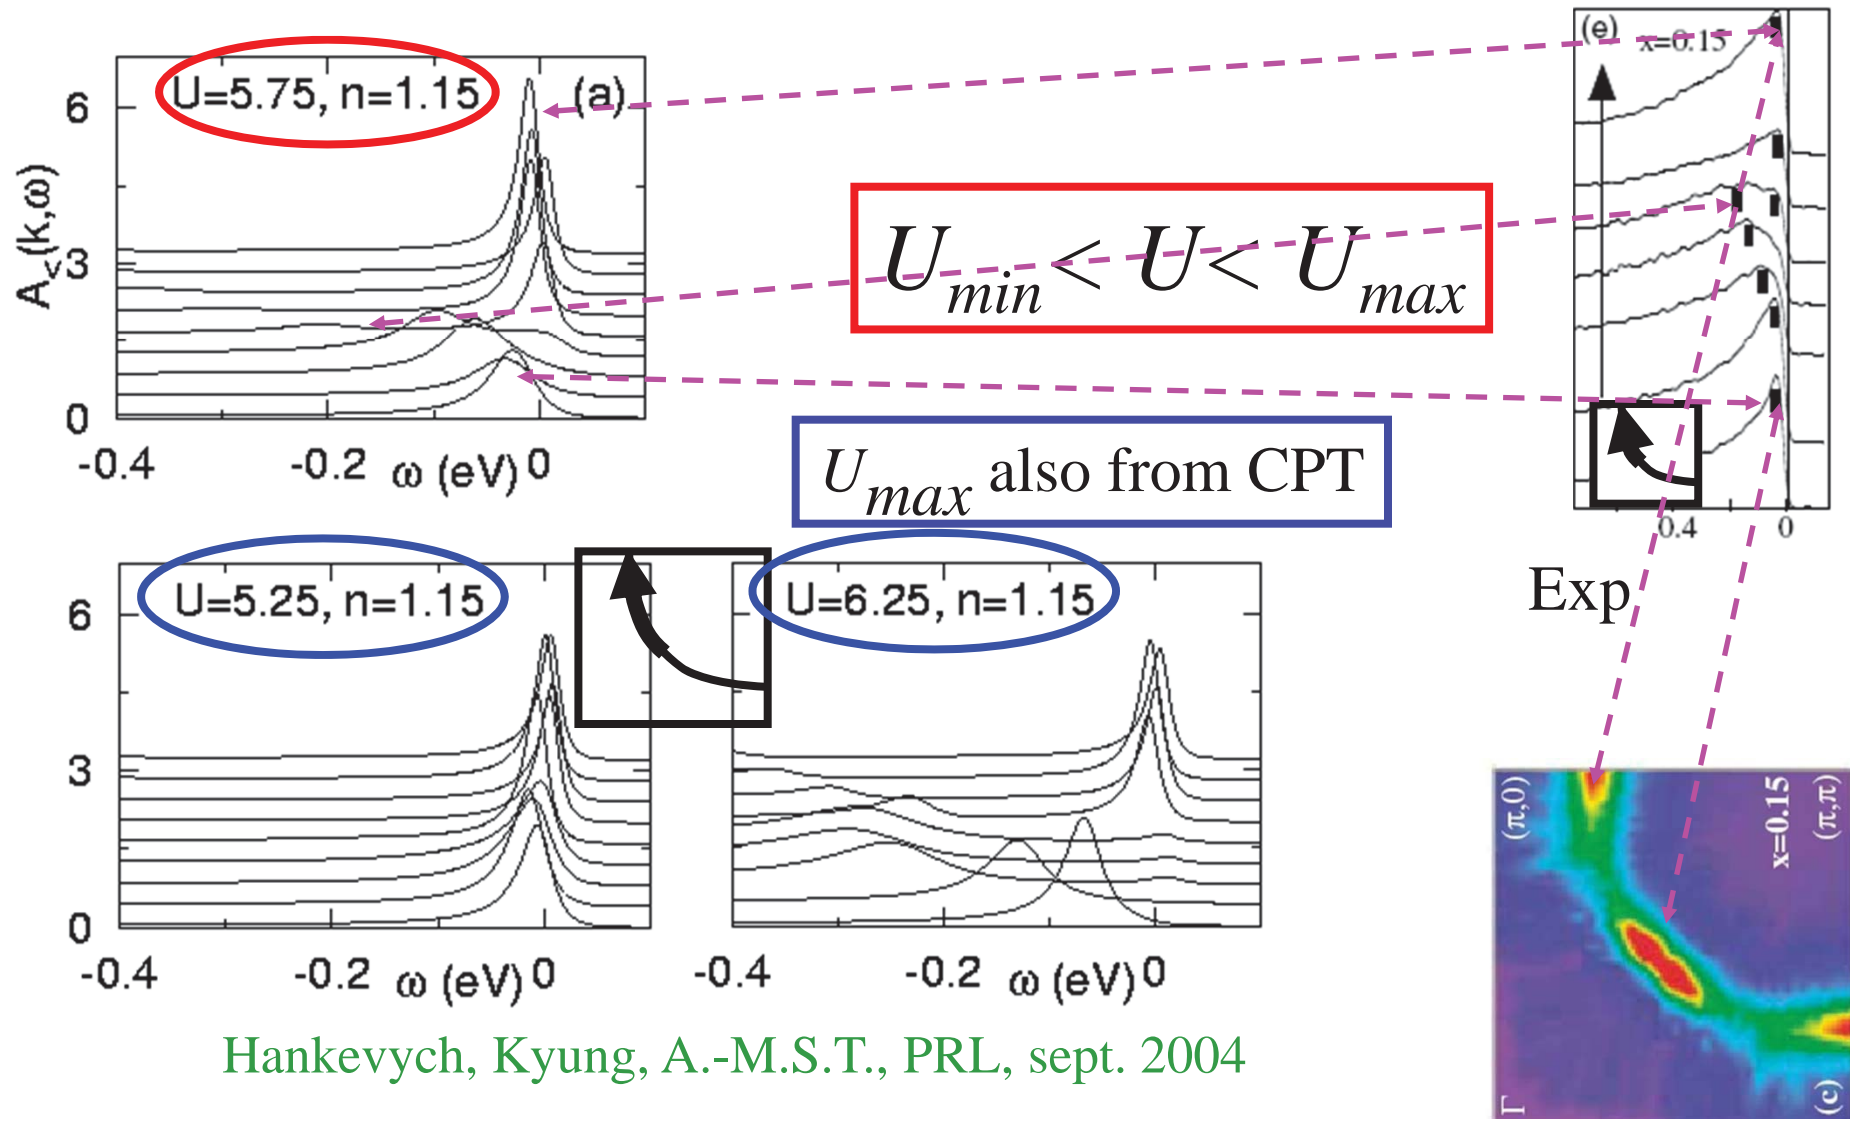

$d = 2$
