
Neuroscience des émotions musicales

Isabelle Peretz

Professeure en psychologie

BRAMS, Université de Montréal

Conférencière invitée, Collège de France

Université de Montréal

COLLÈGE DE FRANCE 1530

Brams

L'émotion fait partie intégrante de l'expérience musicale

Les enquêtes révèlent que:

- ✓ La musique est une des plus grandes sources de plaisir (e.g., Dubé et Lebel, 2003)
- ✓ La musique est utilisée pour canaliser et modifier nos émotions (e.g., Tia De Nora, 2001)

Antecedents	*Mean*	(SD)

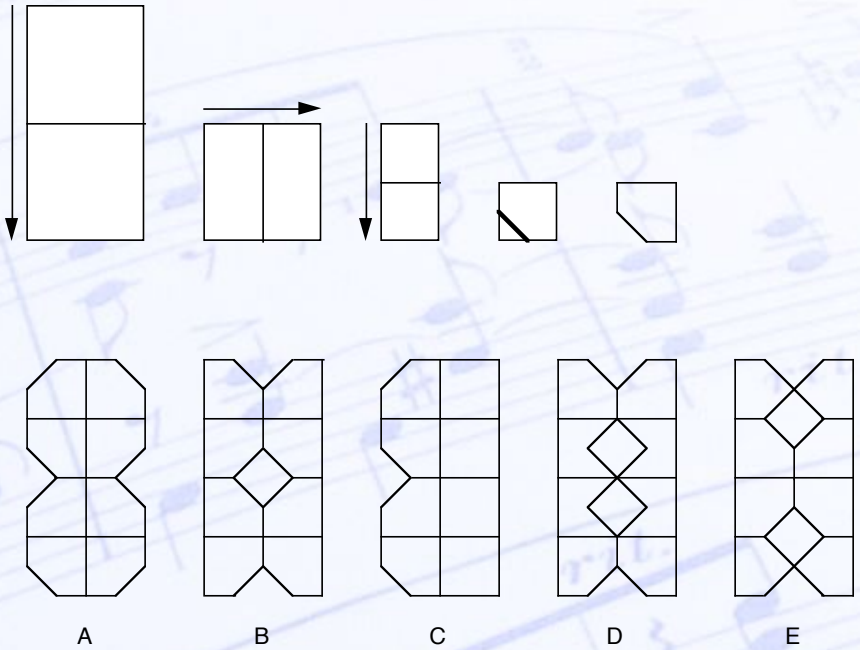
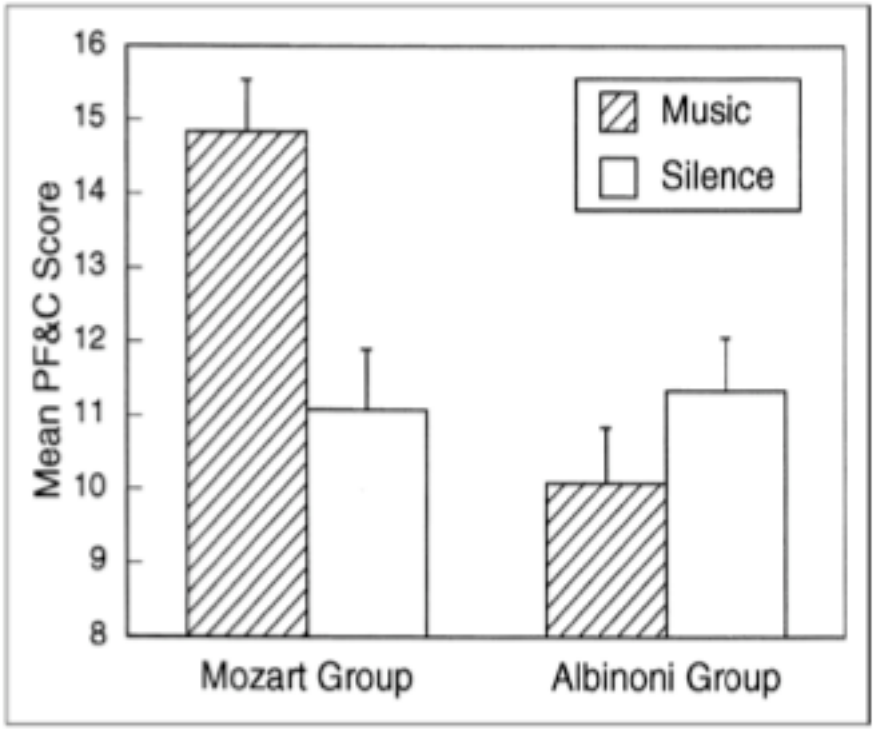
“The Mozart effect”





Thompson, Schellenberg, & Husain (2001) Psychological Science

"The Mozart effect" = an emotional effect

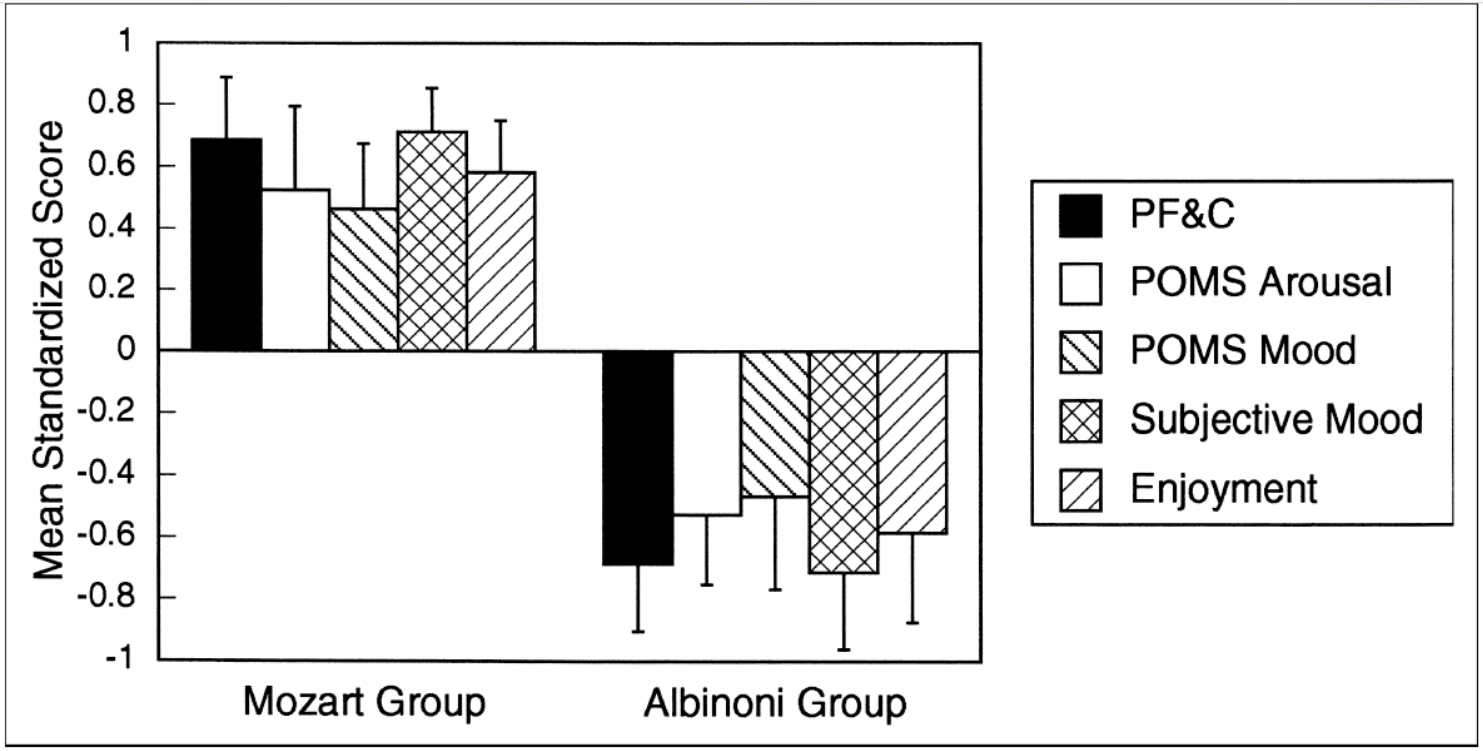


Fig. 2. Participants' mean standardized scores on five measures after listening to Mozart or to Albinoni. Scores are shown for the paper-folding-and-cutting (PF&C) task, Profile of Mood States (POMS) arousal subscale, POMS mood subscale (reverse coded), subjective mood-arousal ratings, and enjoyment ratings. Error bars illustrate standard errors.

Thompson, Schellenberg, & Husain (2001) Psychological Science

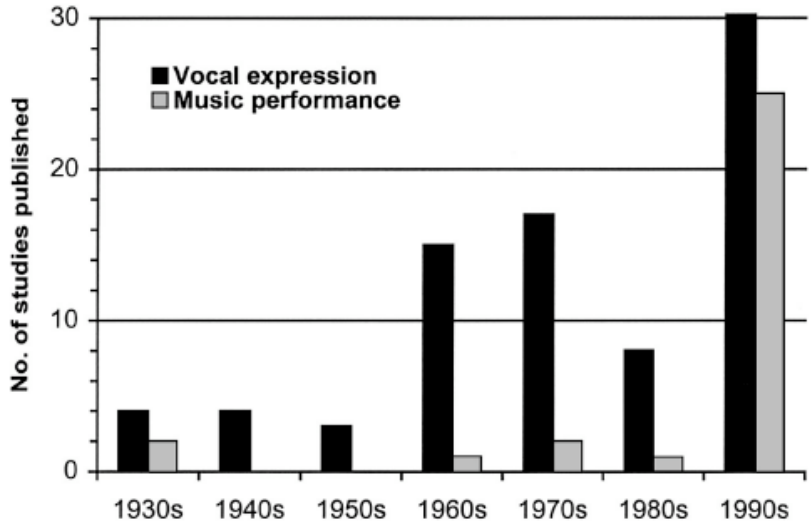
Communication of Emotions in Vocal Expression and Music Performance: Different Channels, Same Code?

Patrik N. Juslin and Petri Laukka
Uppsala University



in music). Juslin (in press) argued that what makes a particular music performance of, say, the violin, so expressive is the fact that it sounds a lot like the human voice while going far beyond what the human voice can do (e.g., in terms of speed, pitch range, and timbre). Consequently, we speculate that many musical instruments are processed by brain modules as superexpressive voices.

La musique comme inducteur d'émotions:

- ✓ Fonctionnel très tôt (inné)
- ✓ Reconnaissance rapide et systématique
- ✓ Fractionnement par type d'émotion
- ✓ Médiation limbique
- ✓ Universaux

Effets indirects

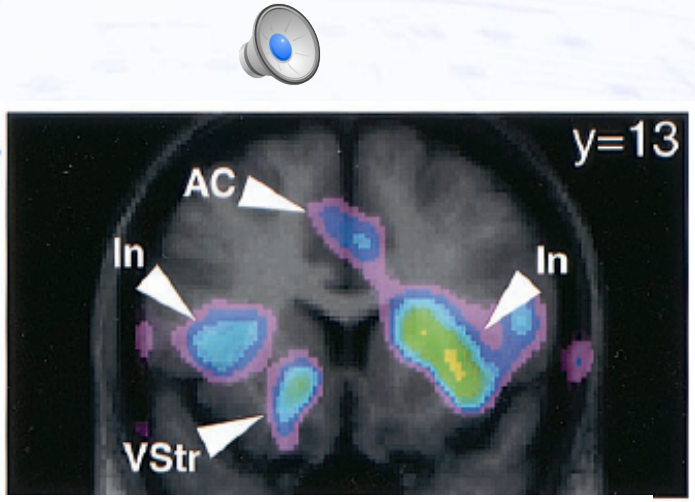
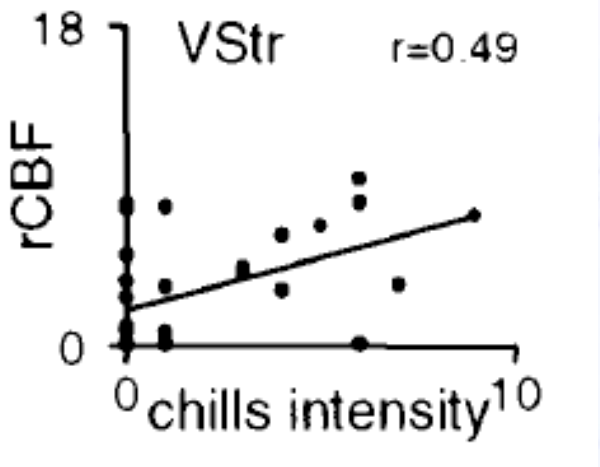
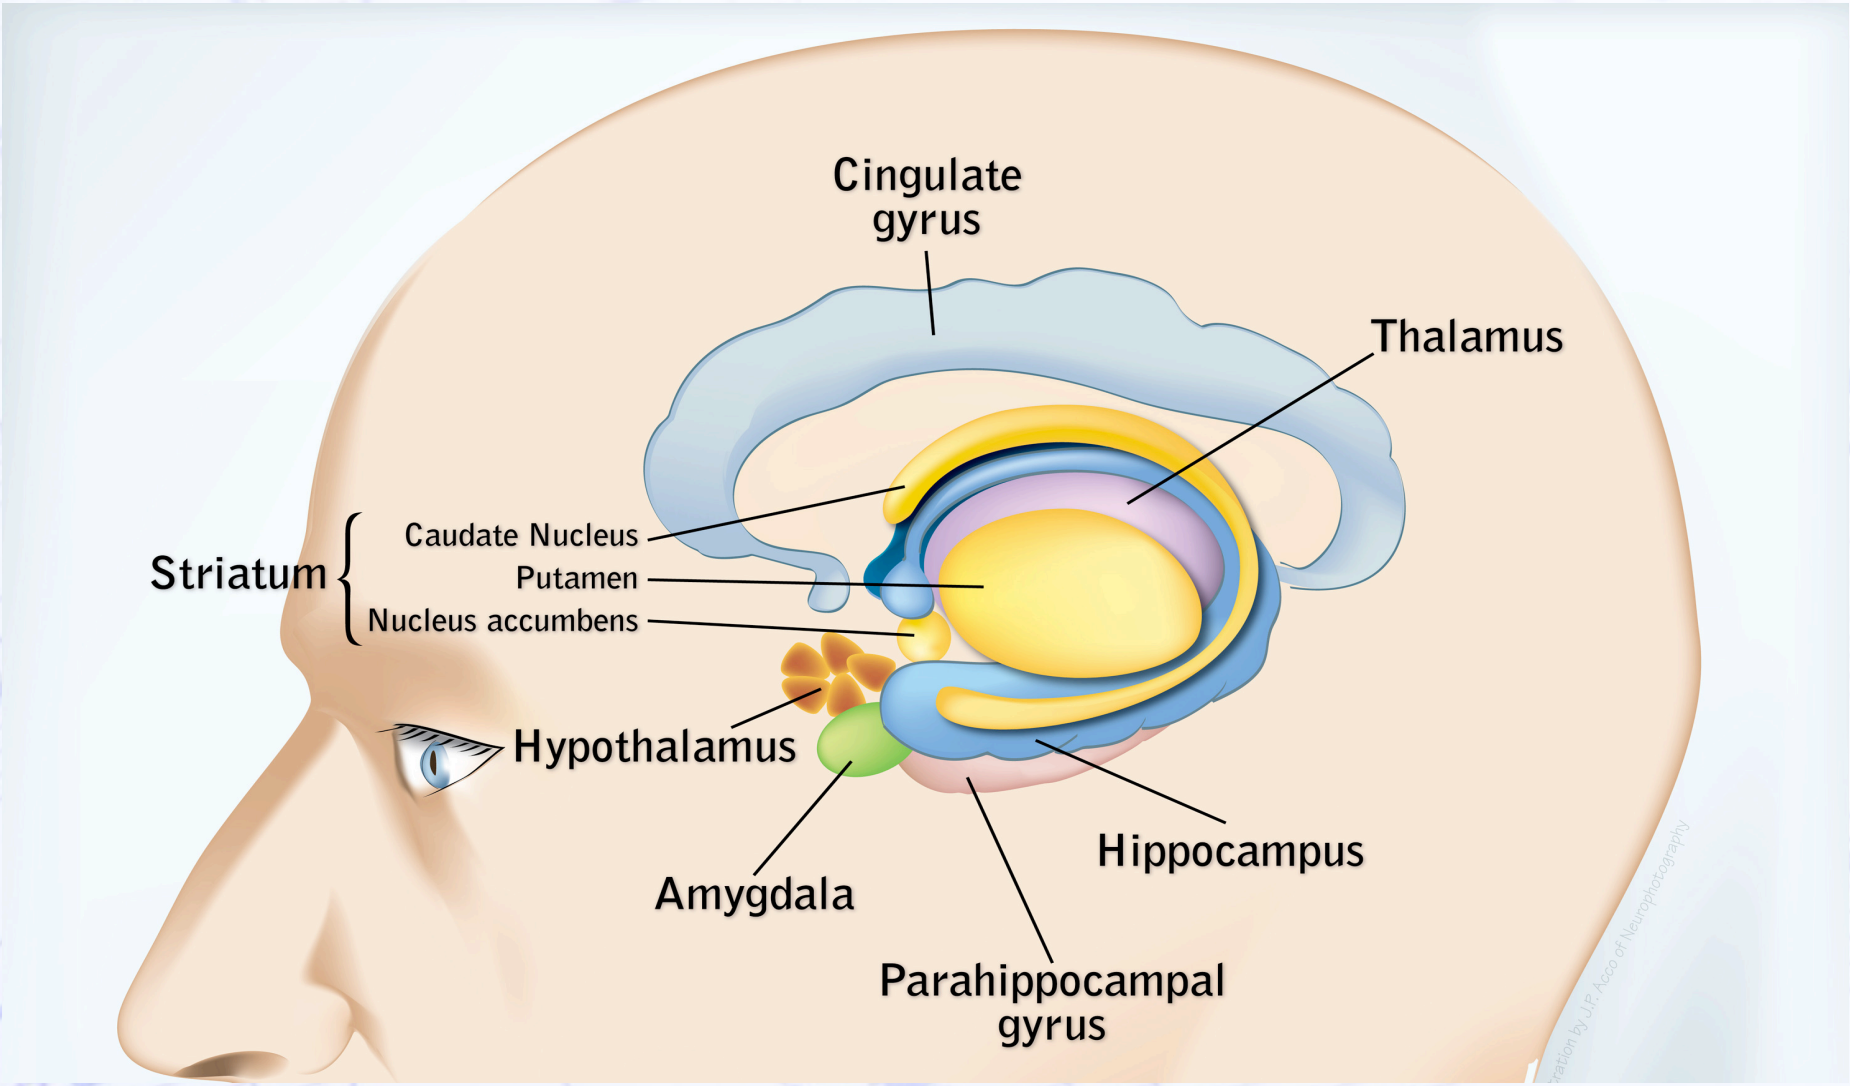
Music activates similar brain structures to other euphoria-inducing stimuli

- ✓ Cerebral blood flow measured (by PET) in response to self-selected music that elicits "chills"
- ✓ As intensity of chills increases, CBF increases in the brain regions related to reward/motivation (e.g., ventral striatum)
- ✓ Same brain structures respond to other euphoria-inducing stimuli (chocolate, sex, cocaine)
- ✓





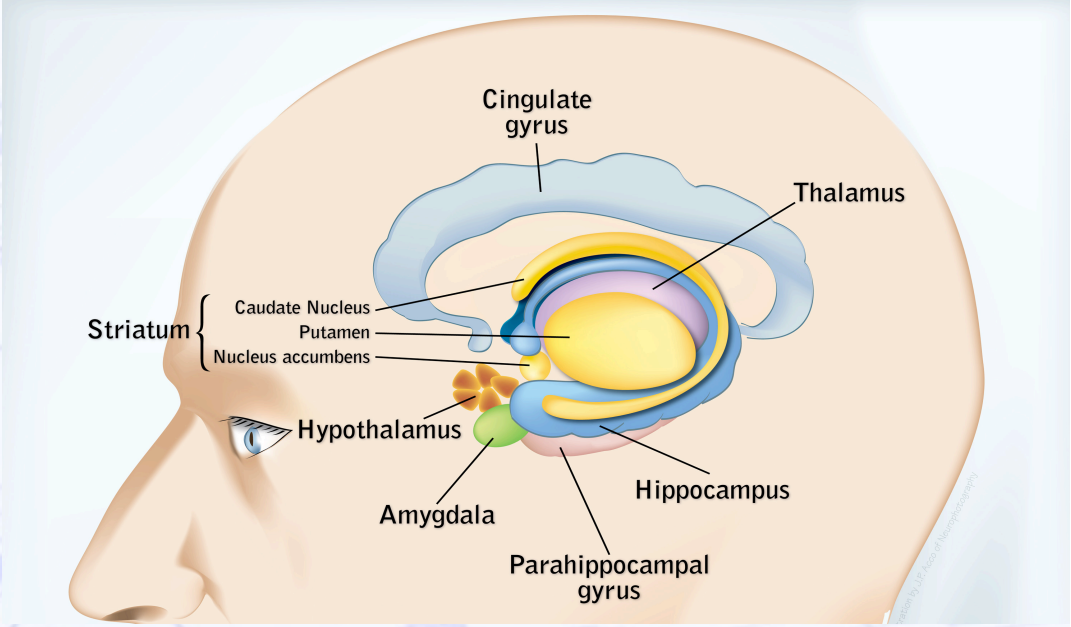
Blood & Zatorre (2001) PNAS



Ventral striatum related to opioid-mediated reward, to dopamin-mediated motivation

The amygdala and perception of danger

- Conditioned fear in both rats and humans
- Uncontrollable rage reactions in both animals and humans
- Recognition of fearful expressions in faces
- Recognition of fearful vocal expressions (screams, yells) and speech prosody. *Not always.*



Scary music recruits similar brain structures (the amygdala) as other fear-related stimuli

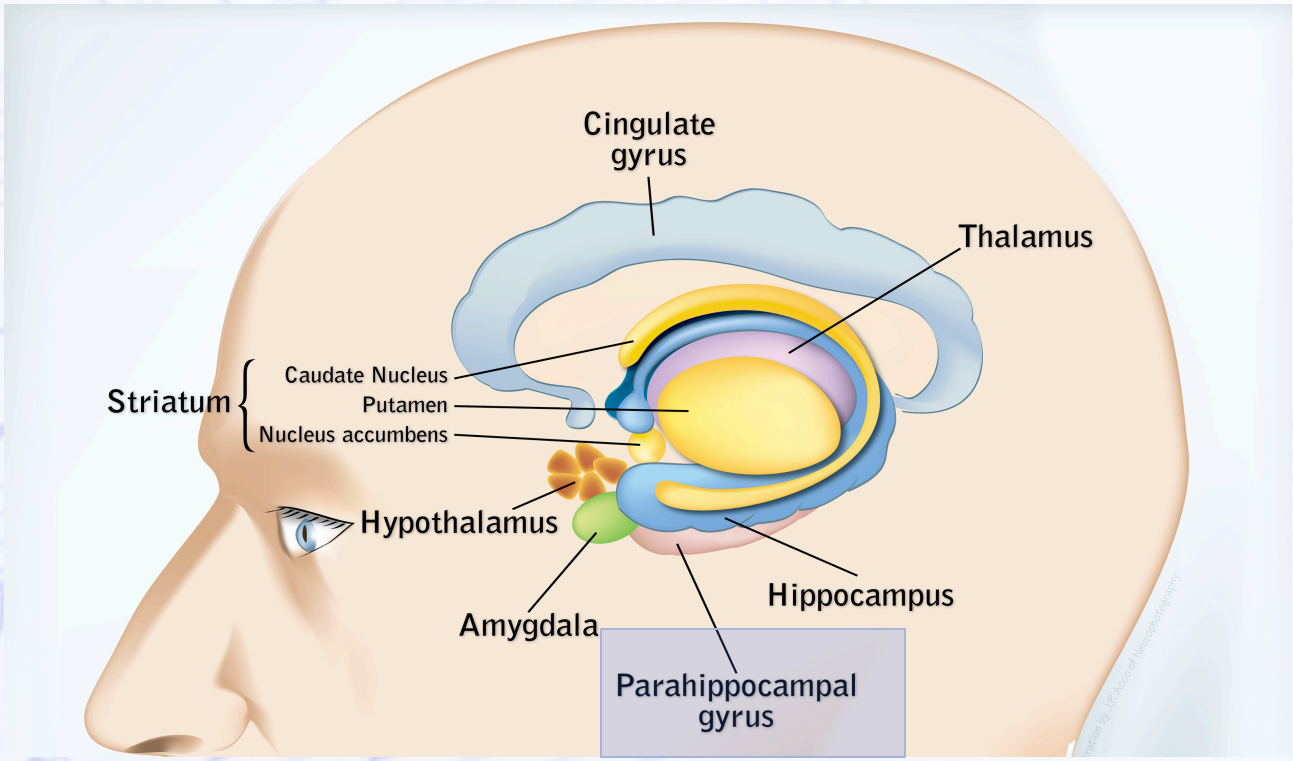
Emotional responses to unpleasant music correlates with damage to the parahippocampal cortex

Nathalie Gosselin,[1] Séverine Samson,[2,3,6] Ralph Adolphs,[7] Marion Noulhiane,[3,6] Mathieu Roy,[1] Dominique Hasboun,[3,4] Michel Baulac[2,5] and Isabelle Peretz[1]



Emotional evaluation of dissonance

- Same pool of classical excerpts (half “happy”, half “sad”).Half in their original (consonant) version; half in a dissonant version. Dissonance was created by shifting the melodic voice by 1 semitone.

Vivaldi (consonant)

Haendel (consonant)

Vivaldi (dissonant)

Haendel (dissonant)

- Emotional responses to dissonance are typically expressed in “pleasant-unpleasant” judgments

judgments on a 10 point-scale + “Happy-sad” judgments, as a control task.
